TITLE: Some remarks concerning heat resisting tubes 4

SOURCE: Hutnické listy, no. 9, 1965, 644-650

483

TOPIC TAGS: carbon steel, metal tube, creep, austenitic steel, pipe, heat resistant steel

ABSTRACT: The materials required for heat resisting tubes, and the metallurgical treatment of these tubes are discussed. The equipment necessary to make the proper evaluation of these tubes is described. Carbon steel tubes cannot have good creep properties at higher temperatures. Alloying of carbon steels cannot give good results; the tubes in service at high temperatures undergo spheroid formation and early creep. Unkilled steel has better creep properties because it has a larger grain size. Increase of the creep temperatures is achieved in low alloy steels by carbide stabilization, that is by reducing the ability of the carbides to coagulate or to form alloys with ferrite. Austenitic steels have higher creep strength. Various causes of damage to carbon steel low alloy pipes are discussed. Orig. art. has: 25 figures and 1 table. [JPRS]

TITLE: Contribution to the problems in tin coating

SOURCE: Hutnicke listy, no. 12, 1965, 866-872

TOPIC TAGS: metal coating, tin, electroplating, sheet metal, metallurgic process, industrial management

ABSTRACT: Coatings obtained by electroplating are compared to hot dip coatings. FeSn<sub>2</sub> interlayer on an electrically coated sheet is formed only during the short period of reheating and is thinner than the one formed in the hot dip process. This improves the mechanical properties of the tinned sheet. At the same time the tin layer is thinner and thereby the process is more economical. The only disadvantage of the electroplating process is its higher power consumption. The electroplated tinned sheets show also a higher corrosion resistance than the hot dipped sheets. Orig. art. has: 18 figures and 2 tables. [Based on authors' Eng. abst.]

TITLE: Transmitter Tubes QQE 03/12 and QQE 03/20

PERIODICAL: Sdělovací technika, 1961. No. 8, pp. 307 - 308

TEXT: The above tubes were developed and produced by TESLA Rožnov. The first tube is a double beam transmitter tetrode having a maximum anode dissipation of 5 W. Constructionally, it is in the form of an all-glass envelope with a noval base. It is provided with an indirectly-heated oxide cathode which is common to the two tetrodes. Also, the second grid is common. The centre tap of the heater filament is connected to a pin so that the heater can be connected either in series or in parallel. The tube has the following interelectrode capacitances:  $C_{g1} = 6.2$  pF;  $C_a = 2.6$  pF and  $C_{ga} = 0.1$  pF. A tube can therefore be used at frequencies up to 200 Mc/s. The control grids of the tube are gold-plated in order to reduce their thermal emission; the second grid is blackened. The maximum operating temperature for the

Microbe Macrocolonies  
Orig Pub : Sbor. Narodn. musea Praze, 1957, B13, No 1-2,  
24-52

Abstract : The study of macrocolonies of various species  
of bacteria in different solid media of  
various agar concentrations indicates that  
clearly defined zones in them are often  
developed in 24 hours. The zones are

particularly clearly established in 48-72 hours of cultivation in media with an agar concentration of 2.5%. The ability to form especially sharp zones is established by one strain of Pseudomonas "cychro", which in all these media formed macrocolonies in 24 hours; in these macrocolonies, 3 clearly circumscribed zones stood out in 48-72 hours. Sharp differences in biochemical activity in the subcultures obtained from various zones of the colonies of the Pseudomonas "cychro", developed; particularly, the greatest activity of fermentation in various hydrocarbons is displayed by the culture originating in the

zone designated "Vicin", which formed at the edge of the colony in the form of a rising shaft. These differences in biochemical activity in the cultures, developed in various parts of the colony, proved to be fixed hereditarily. On the basis of the results obtained, the authors worked out a method of a "two-phase" selection of the strains having industrial value. -- G. P. Kalina

TITLE:

Paleozoic Structural Facial Subzones of the Turkestan-Alay System of Mountains (Southern Tien-Shan) (O paleozoyskikh strukturno-fatsial'nykh Podzonakh Turkestan-Alayskoy gornoy sistem, (Yuzhnyy Tyan'-Shan')

PERIODICAL:

Izvestiya Akademii nauk SSSR, Seriya Geologicheskaya, 1958, Nr 8, pp 65-76 (USSR)

ABSTRACT:

The author divides the Turkestan-Alay system of mountains into 2 groups of subzones, clearly defined by their structural characteristics. The first group is comprised of the Zeravshan-East Alay, the High Foothills subzones formed by Lower (?) - and Middle Paleozoic geosynclines of the second kind, and by Upper-Paleozoic anticlines of the second kind. The second group is formed by the Gulcha and Kara-Chatyr subzones, Lower (?) - and Middle-Paleozoic geoanticlines of the second kind, and Upper-Paleozoic geosynclines of the second kind. This means, that the subzones of the second group have an inverted rhythm of basic oscillatory movements. These movements also determinate the different occurrence of all other geological processes in each subzone, and explains the different structure of their Paleozoic foundation. The main differences are as follows: 1) The subzones of the first

Card 1/5

SOV-11-58-8-6/14

Paleozoic Structural Facial Subzones of the Turkestan-Alay System of Mountains

group have a powerful Lower (?) - Middle - Paleozoic foundation formed by shist-effusive-carbonaceous layers, representing opensea deposits. The Upper-Paleozoic accumulation are almost absent; they are found only in separate local depressions and are formed by coarse clastic rocks. The Paleozoic foundations of the subzones of the 2nd group are of an exactly opposite type; 2) Folding Paleozoic structure of the subzones of the 1st group was formed by Lower-Permian movements with a notable participation of pre-Upper-Carboniferous movements. The structure of the subzones of the 2nd group was formed later by the Upper-Permian movements with the participation of Lower-Permian movements; 3) The magmatic process was different in both groups, due to their different age of formation. During the period of general sinking (corresponding to the Lower - Middle Paleozoic period for the first group and Upper-Paleozoic - for the second group of subzones), the subaqueous outflow of basic and average effusives occurred. At the end of the Paleozoic geosynclinal stage (for the subzones of the first group - in the Lower Permian (?) period, and for the second group - in Upper Permian period), together

Card 2/5

SOV-11-58-8-6/14

Paleozoic Structural Facial Subzones of the Turkestan-Alay System of Mountains

with the basic phase of folding formation, the massive penetration of acid intrusives occurred; 4) The scheme of folding formations in the Turkestan-Alay system in the first group, was the development of sagging of the synclinal structures in the Lower (?) - middle Paleozoic period, with the amplitude of the sagging increasing from the periphery to the central part of the subzones. On the boundaries of Lower and Middle Carboniferous period the general sagging of these subzones is replaced by their general elevation. The folding Hercynian structure of the first group, formed at the end of their Upper-Paleozoic elevation, presents an obvious synclorium. In the subzones of the 2nd group, a general elevation of the anticlinal structures was developed during the Lower (?) - Middle Paleozoic period, with the amplitude of the elevation increasing from the periphery to the central parts of the subzones. On the boundaries of the Lower and Middle Carboniferous periods this elevation is replaced by general sagging. The folded Hercynian structure of the 2nd group formed by the end of the Upper Paleozoic depression (on the beginning of the Upper Permian period) formed in general an anticlinorium. 5) The sharp inversion of the oscillatory move-

Card 3/5

SOV-11-58-8-6/14

Paleozoic Structural Facial Subzones of the Turkestan-Alay System of Mountains

ments in both groups of subzones does not involve the inversion of the basic folded structures because the general elevation of the first group and the general sinking of the second occurred in separate blocks divided by a plutonic break. The author substantiates his findings with numerous studies of other geologists, although he disagrees with some of them. Following geologists were mentioned by the author: A.V. Peyve, V.I. Popov, N.M. Sinitsy, D.P. Rezvoy, A.D. Arkhangel'skiy, N.S. Shatskiy. There is 1 table, 3 maps and 6 Soviet references.

*ca*

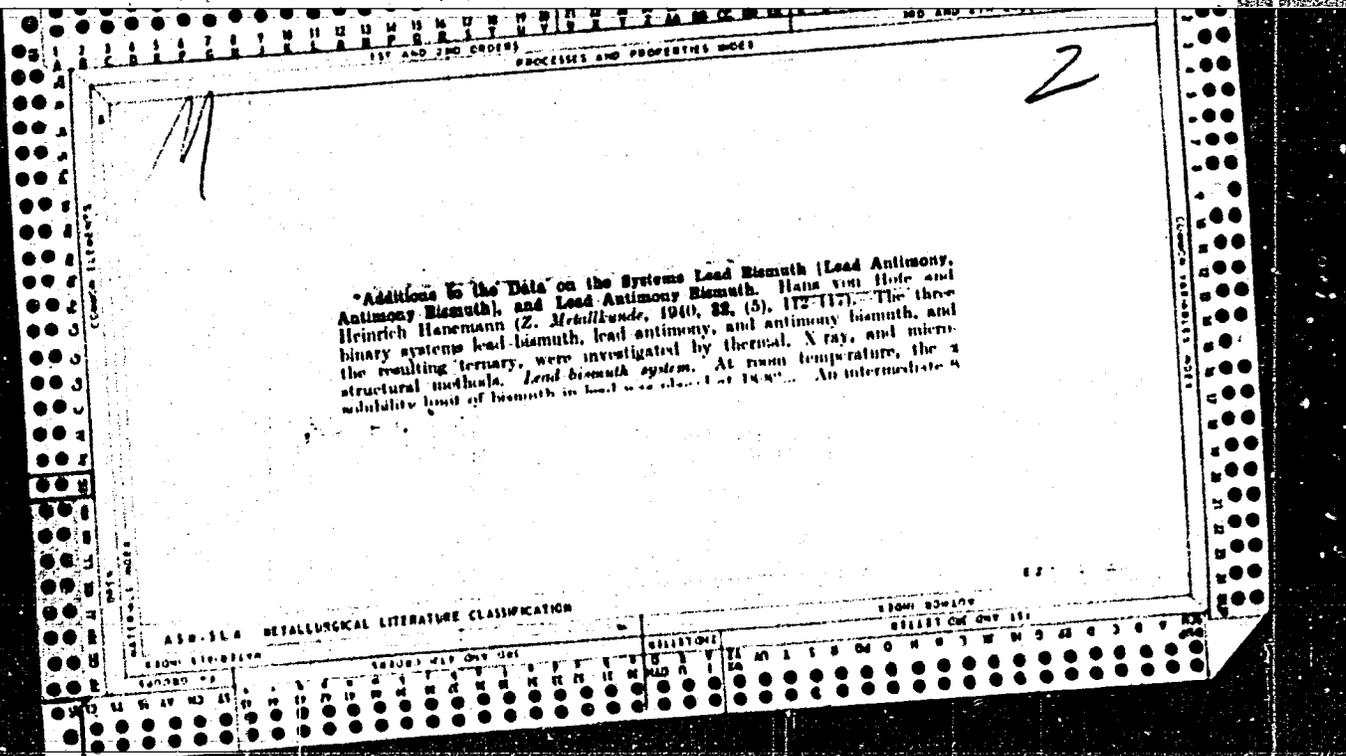

"Reduced shrinkage" of cement and the bulk density of the clinker. H. Elsner von Grotow. *Zement* 26, 217-19 (1937). The "reduced shrinkage" ( $S$ ) (shrinkage on aging for 24 or 35 days divided by the sum of the tensile strength and  $1/3$  the compressive strength) is lower for rapid-hardening than for ordinary portland cement. Taking the bulk density of the clinker fraction between 5 and 7 mm. ( $D$ ) as an index of correct burning,  $S$  is independent of  $D$  from  $D = 1.2$  to  $1.5$ , but rises sharply for over-burnt clinker ( $D = 1.6$ ). The same results were obtained after the cements had been stored for 2 months. H. C. A.

"Oral Mass Vaccination with a New Attenuated Type 3 Poliovirus. State of Serum Immunity of Selected Groups of the Child Population."

Prague, Casopis Lekaru Ceskych, Vol 105, No 36-37, 9 Sep 66, pp 999 - 1003

Abstract [Authors' English summary modified]: Poliovirus 3 Leon 12 a<sub>1</sub>b was used in one region and virus USOL D bac in the other. The second type produced persistent antibodies in a high percentage of children; results with the other are not conclusive. 3 Tables, 8 1/1 Czech references. (Manuscript received May 66).

\*von Kerner, Fritz. Ein Instrument zur Messung des Thauwasserchlages. [An instrument for measuring dew precipitation.] *Meteorologische Zeitschrift*, 9(3) 106-108, March 1892. DLC--The author describes in detail a new instrument which is based on the principle of the gravimetric hygrometer. The observations in Vienna during the summer of 1891 showed that the amount of dew can be as much as 0.3 mm on calm, clear nights. A very small amount of dew was observed with southerly winds and in cloudy nights. *Subject Headings:* 1. Drosometers 2. Dew data 3. Vienna Austria.

PROCESSES AND PROPERTIES INDEX

BC

A-1

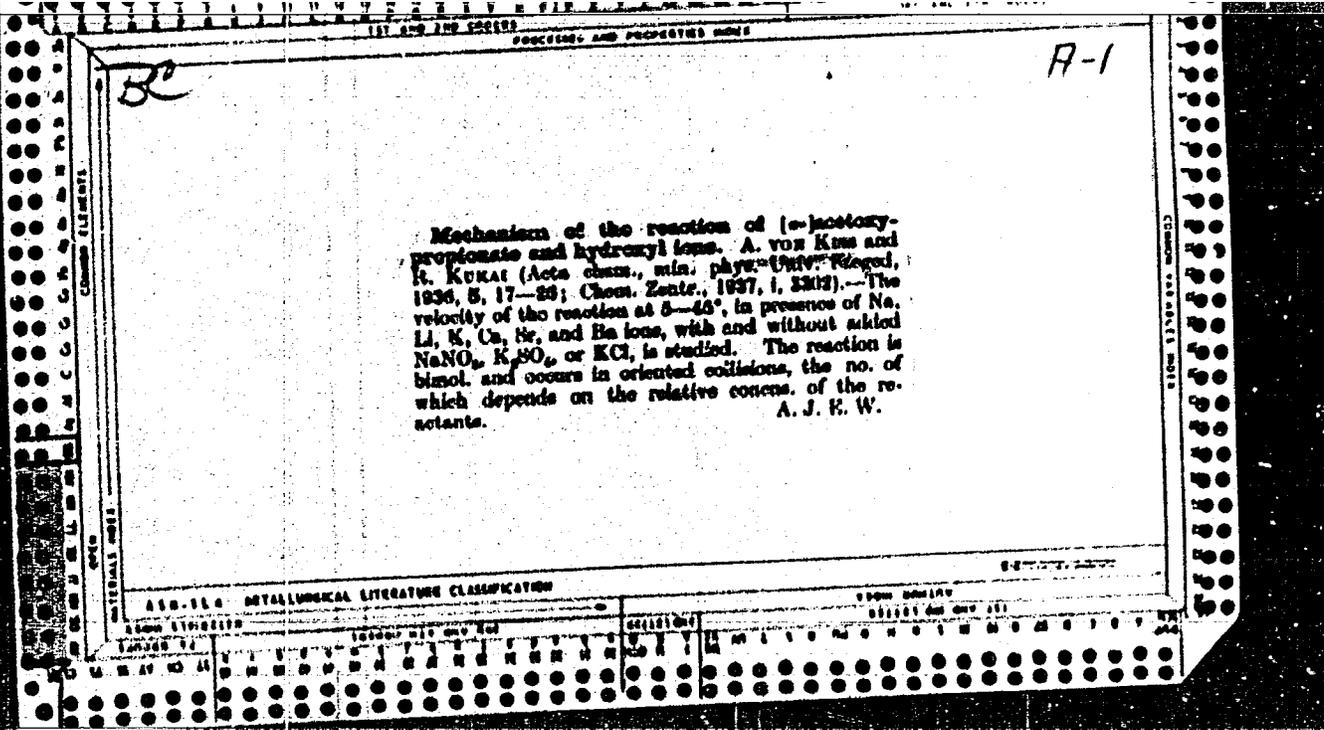

Mechanism of the reaction of monobromo-  
acetate and hydroxyl ions. A. von Kam, and  
L. BORSÁNYI (Acta chem. sci. phys. Univ. Szeged,  
1936, 8, 10-17; Chem. Zvest., 1937, 1, 332).—The  
velocity of the reaction  $\text{CH}_3\text{BrCO}_2 + \text{OH}^- \rightarrow$   
 $\text{OH-CH}_2\text{CO}_2 + \text{Br}^-$  at 45° in aq. solutions containing  
 $\text{Na}^+$  is in quant. agreement with the Brønsted-  
Debye-Hückel equation for ionic strengths 2-0.03, if  
allowance is made for the hydrolysis of  $\text{CH}_3\text{BrCO}_2$ ,  
which introduces an abnormal salt effect.  
A. J. E. W.

B-III-4

Composition of European mussel products.  
 V. Feeding value of mussel shells with special  
 reference to the vitamin-D content. R. BROWN  
 and L. van E. KONINK (Netherlands, 1958, 11,  
 122-127). The vitamin-D content of sun-dried  
 shell was 28 and of artificially dried material 2,  
 international units. Ultra-violet irradiation of the  
 sun-dried material increased the D content to 38  
 units. (See also report of the author, A. G. RAN...

PROCEEDS AND PROPERTY INFO

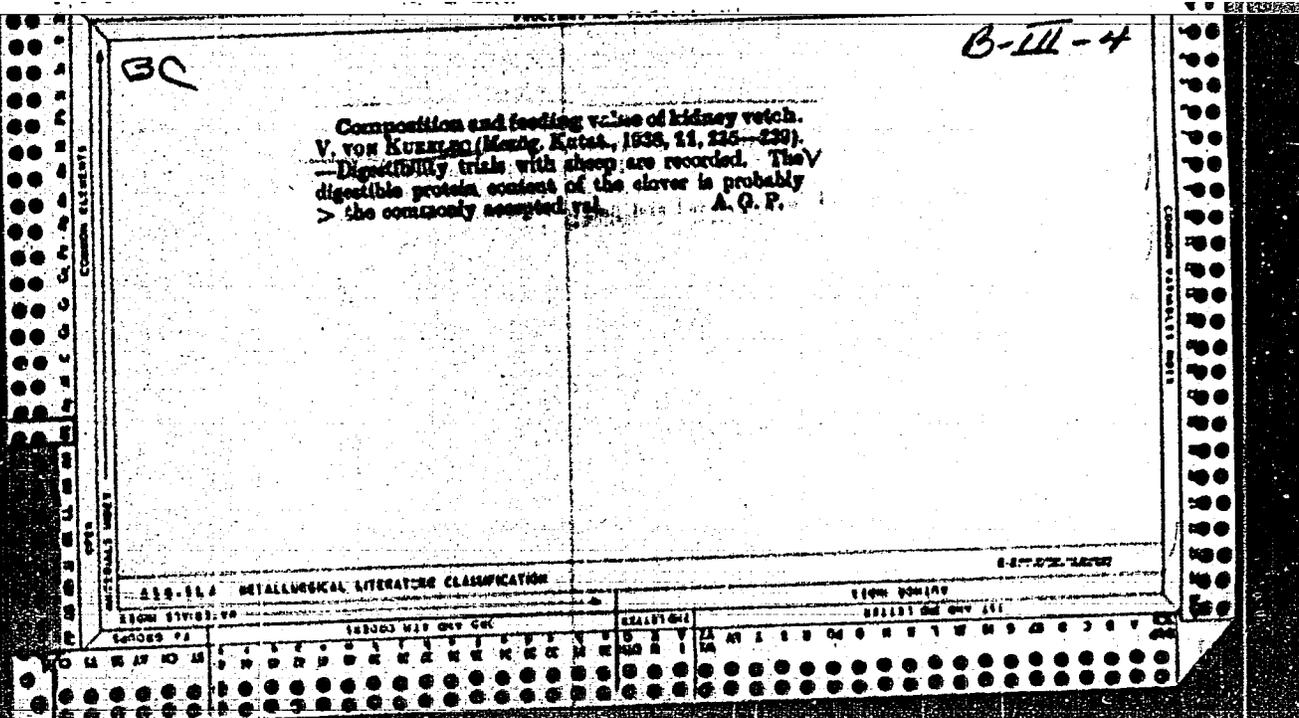

B-III-4

BC

Feeding value of various tobacco seed meal.  
V. W. KENNEDY (Texas Tech) (1954, 21, 169-171).  
In feeding trials with sheep, the meal showed  
chemical protein 28.7% (Crude protein 27.6%)  
and starch equiv. 27.4%.

PROCESSING AND PROPERTIES INDEX

12

CA

The composition and nutritive value of Hungarian varieties of meadow hay. V. Viktor von Kutschok. *Magyarorszagai Kutatások* 16, 745-748 (1943); *Chem. Zentr.* 1944, II, 283; cf. *C.A.* 38, 4717P.—The botanical and chem. compos. of samples of hay from 7 different regions of Hungary are reported. The nutritive value of the specimens was det'd. by digestion tests on sheep. M. G. M.

PROCEDURES AND PROPERTIES INDEX

2-4

BC

Action of colloidal substances on crystallization, with reference to the problem of stone formation. H. von KÖRNY (Magyar orvosi Arch., 1934, 32, 289-297; Chem. Zentr., 1935, 1, 2309). Urine and bile are to be considered as supersaturated solutions, in which normally crystallization or condensation formation should begin, but the colloidal or surface-active substances of high mol. wt. exert a protective action. Model experiments with  $PbI_2$  indicate the mechanism of this action of the colloids to be by selective adsorption in stages. R. N. C.
